RETAINING WALL BLOCKS

Retaining wall blocks are used to support soil laterally and retain it at different levels on two sides.

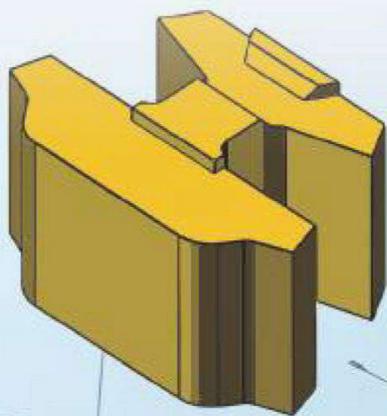

These blocks are commonly used to shape the landscape or control slopes in areas like hillside farming, roadway overpasses, or railway underpasses.

Retaining wall blocks are typically self-draining structures, allowing water to flow freely.

Proper drainage is crucial to limit the pressure on the wall's design value.

Drainage materials are used to reduce eliminate hydrostatic pressure and improve stability behind the retaining wall.

Crane loading and unloading gives zero breakage

Available Sizes		
Length	Width	Thickness
450 mm	300 mm	215 mm
